## Frame the demo on business outcomes — never functionality

|                                                                                    |                                                   |                                                                |                                                        |                                                     |
|------------------------------------------------------------------------------------|---------------------------------------------------|----------------------------------------------------------------|--------------------------------------------------------|-----------------------------------------------------|
| PAIN<br>VP of Plant Operations can't get answers in time for the Production Review | REASON<br>Every new question = 3-5 day DE backlog | IMPACT<br>Missed committee, sized exposure, regulator scrutiny | CAPABILITY<br>Build-time AI on the governed gold layer | PROOF<br>Live model build in 90 seconds — on screen |
|------------------------------------------------------------------------------------|---------------------------------------------------|----------------------------------------------------------------|--------------------------------------------------------|-----------------------------------------------------|

**The mantra:** the win is not that dbt Wizard *can* author a model. The win is that the VP of Plant Operations walks into the next Production Review with a tested, lineage-tracked answer that did not exist this morning.

Every beat below ties to that one sentence.

## The 3-minute script • five beats

### 00:00 – 00:25 Beat 1 • The stakeholder hook

#### WHAT YOU SAY (25S)

*"It is Friday morning at Vantex Manufacturing. The VP of Plant Operations needs to know: Why has OEE on our stamping line dropped 19 points over the last three weeks despite no changes to production schedule or staffing? Production Review is in 14 hours. Today that costs three-to-five days of DE work and a missed meeting."*

#### WHAT YOU SHOW

Open the **Scenario page** ( /scenario ). The VP of Plant Operations's question is the first thing in frame. Let the T-minus counter tick.

**OUTCOME → Anchors the audience on a real business question, not a feature.**

### 00:25 – 00:50 Beat 2 • The cost of the gap

#### WHAT YOU SAY (25S)

*"There is no gold-layer mart that answers this. Three days from now the team might land it. The Production Review will have already happened. A \$4.6 million downtime exposure this quarter — and that is just the dollars we can see."*

#### WHAT YOU SHOW

Stay on Scenario. Highlight the four KPI tiles: 3-5 days, 90s, \$4.6M, T-minus to Production Review.

**OUTCOME → Quantifies the cost of the gap. Sets up the 90-second proof.**

### 00:50 – 02:20 Beat 3 • The live build (proof moment • DE-anchor)

#### WHAT YOU SAY (90S)

*"We click Run the Build. Four sub-agents — Explorer, Summary, Worker, Verification — open the dbt project, find the right grain, pull a slice of the gold layer, write the new model, write its tests, and materialize it as an Iceberg snapshot. The viewer sees the SQL appear character by character. By the time we are done talking, the model exists, the tests pass, the lineage graph has updated."*

**Pause once at:** "Worker is anchoring the CTE to the grain the VP of Plant Operations asked for — not a notebook-grade approximation."

**And again at:** "Verification is writing a uniqueness test on the natural key. This is a governed gold asset, not a SQL snippet."

#### WHAT YOU SHOW

Click into /wizard-live . Let the playback run at 1x. The agents type SQL and YAML in real time. The step rail moves Discovery → Schema → Inspection → Model Creation → Tests → Materialization. Terminal-window aesthetic.

**OUTCOME → Data engineers see the loop end-to-end. The wow is that the output is a tested, governed asset — not a snippet pasted into Slack.**

## 02:20 – 02:45 Beat 4 • The outcome (P&L tie-back • business-anchor)

### WHAT YOU SAY (15S)

"The new mart is materialized. The Production Review convenes in 14 hr, not three days. The VP of Plant Operations walks in with the answer: press 3 in cell B is showing a vibration signature 38% above baseline in the second half of every shift — 11 of 14 unplanned stops correlate with that vibration window. That is a predictive-maintenance ticket, not a tooling overhaul. And the next time anyone asks this — welding, paint, assembly — the model is already there."

### WHAT YOU SHOW

Cut to /outcome . Materialized model, tests passed, lineage updated, root-cause panel, impact panel. Then quick scroll through the business-user pages (Plant Floor, Quality, Predictive Maintenance, Sustainability) so the audience sees the same gold layer powering the executive read.

**OUTCOME → Closes the loop from question to action AND shows the business-user surface running on the same data.**

## 02:45 – 03:00 Beat 5 • The architectural ask

### WHAT YOU SAY (15S)

"Fivetran lands every source. Iceberg on S3 holds the bytes; the Glue catalog governs the snapshots. dbt Labs builds the marts. dbt Wizard authors the gaps. Snowflake reads the gold layer — and so do Athena, Trino, DuckDB, and Spark. One set of files, five engines. That loop closes for OEE attribution, predictive-maintenance scoring, FPY analysis, and IATF 16949 audit prep — all on the same governed lake. Want to see how this maps to your gold layer? Stop by the Pediment booth or scan the QR."

### WHAT YOU SHOW

Final card with the architecture loop, QR code to [fivetran.com/contact](https://fivetran.com/contact). Tag dbt Labs co-brand.

**OUTCOME → Calls out the architectural pattern. Invites a discovery conversation.**

## Business outcomes to weave through — never lead with features

| OUTCOME THE BUYER FEELS                           | WHAT IT REPLACES         | HOW TO PHRASE IT                             |
|---------------------------------------------------|--------------------------|----------------------------------------------|
| Production Review gets the answer same-day        | 3-5 day DE backlog       | In time for the meeting, not three days late |
| \$4.6M exposure sized in 90 seconds               | Open gap window          | The cost of the gap closed before lunch      |
| Reusable governed mart for every future ask       | One-off notebook scripts | The next person who asks gets it for free    |
| CDO does not add headcount to keep up             | Hiring DE backfill       | Your team stops being the bottleneck         |
| Auditor sees lineage + tests, not a query history | Manual evidence packs    | Examiner-ready by default                    |

## Anti-patterns • what NOT to say

**Don't say:** "It runs dbt show against the warehouse and authors a new model file." **Say:** "Ninety seconds from question to materialized answer."

**Don't say:** "Cortex Analyst." Cortex is intentionally absent from this demo. The story is build-time AI on the governed lake.

**Don't say:** "dbt Wizard generates SQL." Say: "dbt Wizard authors a governed asset — schema contract, tests, lineage, ownership."

**Don't say:** "Look at the typing animation." The animation is the texture, not the value.

**Don't open with the architecture diagram.** Open with the VP of Plant Operations's question. Architecture is the closer.

**Don't skip the business pages.** After the wizard finishes, scroll through Plant Floor, Quality, Predictive Maintenance, Sustainability so the audience sees the persona surface that runs on the same gold layer.

## Discovery prompts to anchor before the demo

### BEFORE YOU PRESS PLAY

- "What questions does your VP of Plant Operations ask that your team cannot answer same-day?"
- "When a stakeholder asks for a new cut of data, what is the average time from ask to merged dbt model?"
- "How many one-off SQL scripts are sitting in someone's Snowflake history that never made it back into the governed layer?"
- "Who is your Economic Buyer for new data investment? Likely audience: VP Plant Ops, VP Quality, Maintenance Director, CIO."

### AFTER THE DEMO LANDS

- "Which of those agent steps — Discovery, Schema, Inspection, Model Creation, Tests, Materialization — is where your team spends the most time today?"
- "If we sized a pilot on three of your highest-value recurring VP of Plant Operations questions, what would success look like in 90 days?"
- "Who needs to be in a 30-minute architecture review to see how this lands on your gold layer? Audience: VP Plant Ops, VP Quality, Maintenance Director, CIO."

## Personas at the booth — split the time

### DATA ENGINEER · 60% OF BOOTH TIME

**Scenario → Live → Outcome → Architecture → Pipeline**

Lead with the question, show the four sub-agents, then walk the architecture (Fivetran + Iceberg/Glue + dbt Labs + dbt Wizard + Snowflake/4 engines) and the Pipeline page with real Fivetran connector deep-links.

### BUSINESS USER · 40% OF BOOTH TIME

**Plant Floor, Quality, Predictive Maintenance, Sustainability**

After the wizard finishes, drop into the dashboard pages. Show that the same governed gold layer powers the executive read. The build-time AI is invisible to them — they see the answer.

## Required follow-up materials

- One-pager · Vantex Manufacturing · at [fivetran-jasonchletsos.github.io/Fivetran-Demo-Repository/one-pager/manufacturing/](https://fivetran-jasonchletsos.github.io/Fivetran-Demo-Repository/one-pager/manufacturing/)
- Live demo URL · [fivetran-jasonchletsos.github.io/Manufacturing-ODI-Demo/](https://fivetran-jasonchletsos.github.io/Manufacturing-ODI-Demo/)
- 3-minute walkthrough video (this recording)
- Architecture diagram on the Architecture tab of the demo
- Cross-industry credibility · Pediment Bank

**Booth-floor reminder:** the demo is built to run unattended on the booth screen. If a prospect walks up mid-playback, do not restart. Pick up the narration where the playback is — that is also the point. The build finishes

whether someone is watching or not. That is the entire pitch.

# THE GOLD LAYER GETS ACTED ON, NOT JUST QUERIED

Activations is the fourth native NewCo stage, right after Transformations. The instant gold.fct\_predictive\_maintenance flags a machine at risk\_score  $\geq 0.85$  within the 7-day risk window — newly flagged or re-scored upward since the last sync — Activations pushes a fully-scoped work order straight into IBM Maximo Application Suite. No export, no reverse-ETL vendor, no hand-keyed ticket.

|                                                                                                                     |                                                                             |                                                                                       |
|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <p>TRIGGER</p> <p><b>risk_score <math>\geq 0.85</math></b></p> <p>7-day risk window, newly flagged or re-scored</p> | <p>DESTINATION</p> <p><b>IBM Maximo</b></p> <p>WORKORDER · Manage / EAM</p> | <p>AVOIDED COST</p> <p><b>\$171,500</b></p> <p>Crimp Press 7, Sterling Heights MI</p> |
|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------|

| WHAT YOU SAY                                                                                                                                                                                                                                                                                                                       | WHAT YOU SHOW                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "Watch what happens after the score, not just the score itself. Crimp Press 7 at Sterling Heights just crossed an 88% confidence bearing-failure prediction — 5 to 9 days out. Every tool in this room stops there: it's an insight sitting in a dashboard, waiting for a human to notice it and re-key a work order into Maximo." | <b>Predictive Maintenance panel → flagged Crimp Press 7 row (STH-L8-CP7, 88% confidence).</b>                                                                                                  |
| "Activations doesn't wait. It reads gold.fct_predictive_maintenance on every dbt run, and the instant risk_score crosses 0.85, it pushes a fully-scoped work order — asset, description, priority, target start date — straight into Maximo. No export, no CSV, no second integration to babysit."                                 | <b>Click the flagged row → trigger the Activation → /activations-live: Segment Definition → Field Mapping → API Push.</b>                                                                      |
| "That's the difference between a \$12,500 planned repair and a \$184,000 unplanned failure, decided by whether the work order exists before the bearing lets go."                                                                                                                                                                  | <b>Cut to Maximo: new Priority-1 work order, ASSETNUM STH-L8-CP7, target start date inside the 7-day window, already assigned to Maintenance. Point at the timestamp — minutes, not hours.</b> |
| "One governed risk score, one sync, zero hand-typed tickets."                                                                                                                                                                                                                                                                      | <b>Before/After panel → Reverse-ETL hop row: Census + Hightouch replaced by NewCo Activations, native.</b>                                                                                     |

Sterling Heights MI, asset STH-L8-CP7, Crimp Press 7: \$184,000 reactive bearing failure vs. \$12,500 planned PM window = \$171,500 avoided per prevented incident. Work order dispatched inside the same 5–9 minute sync cadence the gold layer already runs on. Synthetic data — ODI architecture demonstration only, not a real company.
